## Scorpion vehicle design concept

Vehicle is made for two passengers, placed one beside other in more laying then sitting position. It is running on two electro motors placed inside front wheels.

Main power supply is battery charged by solar panel placed under top window and traditional internal combustion engine placed in the rear part of the vehicle running the generator (which is used only as a power supply, not for running the vehicle). Its design is highly aerodynamic and gives passengers extra feeling of security because

cockpit is surrounded by two longitudinal parts holding front wheels.

Because this design is displayed doesn't mean that is free for any use, it may already been bought and owned by any of Dare's clients. So beafore you decide to use it, contact Dare and find out is it available or not!!!
